

Full data ownership & control: On-premise servers give you full control over data storage, access, and protection - ideal for businesses with sensitive information or strict compliance needs.

Independence from internet connectivity: Cloud systems need reliable internet, without it, access stops. On-premise servers keep operations running even during outages.

Tailored software & system requirements: With on-premise, you can customise your software suite to suit your exact needs. You're not limited by the configurations or restrictions of cloud platforms

Why on premise in a cloud-first world?

Physical access and control: Having direct access to your hardware allows for easier troubleshooting, upgrades and ensures compliance.

Predictable costs & long-term investment: Cloud services offer flexibility, but costs can scale quickly. On-premise involves upfront investment but can be more cost effective over time.

Custom backup and disaster recovery: You can design your own backup setup without relying on Cloud provider defaults.
